## **DETAILED ACTION**

### ***Information Disclosure Statement***

The information disclosure statement filed 04/27/05 fails to comply with the provisions of 37 CFR 1.97, 1.98 and MPEP § 609 because the IDS should be filed on form PTO 1449. It has been placed in the application file, but the information referred to therein has not been considered as to the merits. Applicant is advised that the date of any re-submission of any item of information contained in this information disclosure statement or the submission of any missing element(s) will be the date of submission for purposes of determining compliance with the requirements based on the time of filing the statement, including all certification requirements for statements under 37 CFR 1.97(e). See MPEP § 609.05(a).

### ***Specification***

The disclosure is objected to because of the following informalities: It is improper to mention claims in specification. Applicant is suggested to remove the claim numbers from the specification for example in pages 3 - 5.

Appropriate correction is required.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

Art Unit: 2862

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1 - 9 are rejected under 35 U.S.C. 102(e) as being anticipated by Honkura et al. (6,831,457).

The applied reference has a common inventor with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

As to claim 1, Honkura et al. (hereinafter Honkura) discloses a magnetic sensor having a magneto impedance sensor element with electromagnetic coil comprised of: a terminal board (1, fig. 1 and 2) on which an extended groove (111) extending in one direction has been formed; and an electromagnetic coil (3), made with one part of the coil formed spirally inside said extended groove (111) on said terminal board, and joined to each tip of that part the other part of the coil (31, 32) placed across the top of the groove so that together the two parts and form a complete spiral; and insulating material (4) placed in the extended groove (111) on said terminal board (1); and a magnetic sensitive body (2) inserted within said insulating material (4), to which either high frequency or pulse electric current is applied (col. 3, lines 21 - 27); and wherein, when either high frequency or pulse electrical current is applied to said

Art Unit: 2862

magnetic sensitive body, voltage is output from said electromagnetic coil (3) in response to the intensity of the external magnetic field generated in said electromagnetic coil (col. 2, line 66 – col. 3, line 5).

As to claims 2, 6 and 7, Honkura discloses that the magnetic sensitive body is made from of conductive magnetic amorphous metal wire (3, col. 3, lines 29 - 31).

As to claims 3 and 8, Honkura discloses that the inner coil diameter of said electromagnetic coil is less than 100 or 200 micrometers (col. 3, lines 32 - 37).

As to claims 4 and 9, Honkura discloses that the electromagnetic coil has a line spacing separation per turn of less than 50 or 100 micrometers (col. 3, lines 38 - 39).

As to claim 5, Honkura discloses that the length of said magnetic sensitive body has been set at less than 3 mm (col. 2, lines 13 – 19 and col. 3, lines 28 - 29).
